NPDES MS4 Permits

Path to Compliance

Illicit Discharge Detection and Elimination (IDDE)
Agenda

- IDDE Basics
- What is an Illicit Discharge?
- Components of an Effective IDDE Program
What is an Illicit Discharge?
What is an Illicit Discharge?

140 CFR 122.26(b)(2) defines an illicit discharge as:

- Any discharge to an MS4 that is not composed entirely of storm water, except allowable discharges pursuant to an NPDES permit, including those resulting from fire fighting activities.
Illicit Discharge Quiz
1. Sanitary Sewer Backup
1. Sanitary Sewer Backup

YES
2. Groundwater Seepage Into Road Drainage System
2. Groundwater Seepage Into Road Drainage System
3. Car Wash Wastewater
3. Car Wash Wastewater
4. Oil Disposal
4. Oil Disposal
5. Foundation Drain Discharge
5. Foundation Drain Discharge
6. Spill from Roadway Accident
6. Spill from Roadway Accident
7. Leaky Septic Tank
7. Leaky Septic Tank

YES
The Basics:
Illicit Discharge Detection and Elimination
Federal regulations require municipalities designated to obtain a National Pollutant Discharge Elimination System (NPDES) permit (Municipal Separate Storm Sewer System (MS4) Permit) to develop and implement a Stormwater Management Program (SWMP) addressing six (6) Minimum Control Measures (MCMs):

1. Public education and outreach
2. Public participation / involvement

3. Illicit discharge detection and elimination

4. Construction site runoff control
5. Post-construction runoff control
6. Pollution prevention / good housekeeping
MCM #3: Illicit Discharge Detection & Elimination (IDDE)
MCM #3: Illicit Discharge Detection & Elimination (IDDE)

Relative to Illicit Discharge Detection & Elimination (IDDE) and the corresponding Municipal SWMP

- Develop program
- Map MS4 (entire system)
- Conduct screening; identify and remove sources
- Enact ordinance
- Do educational outreach on IDDE

PAG-13 requires implementation and facilitation of six (6) BMPs under MCM #3 for the municipal SWMP
MCM #3: Illicit Discharge Detection & Elimination (IDDE)

• BMP #1
  - Develop and implement a *written* program for the detection, elimination, and prevention of illicit discharges into your regulated MS4s

  - The program shall include the following:
    1. Procedures for identifying priority areas.
    2. Procedures for screening outfalls
    3. Procedures for identifying the source of an illicit discharge
    4. Procedures for eliminating an illicit discharge
    5. Procedures for assessing the potential for illicit discharges caused by the interaction of sewage disposal systems with storm drain systems
    6. Mechanisms for gaining access to private property to inspect outfalls (e.g., land easements, consent agreements)
    7. Procedures for program documentation, evaluation and assessment
MCM #3: Illicit Discharge Detection & Elimination (IDDE)

- **BMP #2**
  - Develop and maintain a map of your regulated MS4. Map must show the location of all outfalls and the locations and names of all surface waters that receive discharges from those outfalls
  
  - Measurable Goals
    1. Update map each permit year and revise as needed

- **BMP #3**
  - In conjunction with the map(s) created under BMP #2, include roads, inlets, piping, swales, catch basins, channels, basins, and other features
  
  - Measurable Goals
    1. Update map each permit year and revise as needed
MCM #3: Illicit Discharge Detection & Elimination (IDDE)

- BMP #4
  - Conduct outfall field screening (pursuant to BMP #1) identify the source of any illicit discharges, and remove or correct any illicit discharges
  - Measurable Goals
    1. In each permit coverage year, at least forty percent of the total number of outfalls should be screened
    2. Keep records in accord with plan
MCM #3: Illicit Discharge Detection & Elimination (IDDE)

• BMP #5
  ➢ Enact IDDE Ordinance. Generally one stormwater ordinance (for IDDE, Construction, BMP maintenance and Act 167). Required content described in DEP “model ordinance”

  ➢ Measurable Goals
    1. Update existing ordinance each permit year, if necessary
MCM #3: Illicit Discharge Detection & Elimination (IDDE)

• BMP #6
  ➢ Provide educational outreach to public employees, business owners and employees, property owners, the general public and elected officials
Questions
More Basics: What is an Illicit Discharge?  
Expanded Definition/Description

1. Illicit discharges are defined as a storm drain that has measurable flow during dry weather containing pollutants and/or pathogens.

   A storm drain with measurable flow but containing no pollutants is simply considered a discharge.

2. Each illicit discharge has a unique frequency, composition and mode of entry in the storm drain system.
What is an Illicit Discharge?
Expanded Definition

3. Illicit discharges are frequently caused when a sewage disposal system interacts with the storm drain system.

4. Illicit discharges of other pollutants are produced from specific source areas and operations known as “generating sites.”
What is a Storm Drain?

• Enclosed pipe
  - Major storm drains = diameter ≥ 36 inches
  - Minor storm drains = diameter < 36 inches

• Open channel
  - Major storm drains = drain more than 50 acres
  - Minor storm drains = drain less than 50 acres
What is a Storm Drain?

- Some “pipes” found in urban areas may look like storm drains but actually serve other purposes
  - Foundation drains, weep holes, etc.
What is a Storm Drain?

• Some “pipes” found in urban areas may look like storm drains but actually serve other purposes
  - Foundation drains, weep holes, etc. (not regulated)
  - Small diameter “straight pipes,” however, are a common source of illicit discharges
    - should be investigated to determine if they are a pollutant source
Storm Drains

• Not all dry weather storm drain flow contains pollutants or pathogens.
  
  ➢ Springs, groundwater seepage, or leaks from water distribution pipes
  
  ➢ Feld testing and/or water quality sampling are needed to confirm whether pollutants are actually present in dry weather flow
Discharge Frequency

- **Continuous**
  - Occur most or all of the time
  - Are usually easier to detect
  - Typically produce the greatest pollutant load

- **Intermittent**
  - Occur over a shorter period of time (e.g., a few hours per day or a few days per year)
  - Because infrequent, harder to detect
  - Can still represent a serious water quality problem

- **Transitory**
  - Occur rarely, usually in response to a singular event such as an industrial spill, ruptured tank, sewer break, transport accident or illegal dumping episode
  - Extremely hard to detect with routine monitoring
  - Can exert severe water quality problems
Discharge Flow Types

• Sewage and Septage
  ➢ Sewer pipes and septic systems

• Wash Water
  ➢ Generated from a wide variety of activities and operations:
    ▪ discharges of gray water (laundry) from homes
    ▪ commercial carwash wastewater & fleet washing
    ▪ commercial laundry wastewater
    ▪ floor washing to shop drains

• Liquid wastes
  ➢ Wide variety of flows, such as oil, paint, and process water (radiator flushing water, plating bath wastewater, etc.)
Discharge Flow Types

• **Tap Water**
  - Flows are derived from leaks and losses that occur during the distribution of drinking water in the water supply system

• **Landscape Irrigation**
  - Flows occur when excess potable water used for residential or commercial irrigation ends up in the storm drain system

• **Groundwater and Spring Water**
  - Flows occur when the local water table rises above the bottom elevation of the storm drain and enters the storm drain either through cracks and joints
  - Where open channels intercept seeps and springs
Discharge Flow Types

- Water quality testing is used to conclusively identify flow types.
- Each flow type has a distinct chemical fingerprint.
- Develop your own “fingerprint” library by sampling each flow type.
- Chemical libraries:
  - sewage
  - septage
  - washwater
  - common industrial flows
Mode of Entry

• Direct
  - Directly connected to the storm drain pipe through a sewage pipe, shop drain, or other kind of pipe
  - Usually produces discharges that are continuous or intermittent
  - 3 main modes of direct entry
    - Sewage cross-connections
    - Straight pipe
      - relatively small diameter pipes that intentionally bypass the sanitary connection or septic drain fields, producing a direct discharge into open channels or streams
    - Industrial and commercial cross connections
Mode of Entry

- Direct
Mode of Entry

• Indirect

  - Flows generated outside the storm drain - enter through storm drain inlets or by infiltrating through the joints of the pipe
  - Generally, produce intermittent or transitory discharges (*exception of groundwater seepage*)
  - 5 main modes of indirect entry
    - **Groundwater seepage** - enters pipe - Continuous or intermittent
    - **Spills** - enters at inlet – transitory
    - **Dumping** - into a storm drain inlet - transitory
    - **Outdoor washing activities** - enters at inlet
      
        *(Outdoor washing may or may not be an illicit discharge)*
    - **Non-target irrigation** - enters at inlet – intermittent
      
        *(from landscaping or lawns that reaches the storm drain system)*
Mode of Entry

- Indirect
Land Use and “Potential Generating Sites”

- Land use can predict the potential for indirect discharges, often intermittent or transitory.
- Many indirect discharges can be identified and prevented using the concept of “generating sites,”

Components of an Effective IDDE Program
Components of an Effective IDDE Program

1. Audit Existing Resources and Programs
2. Establish Responsibility, Authority and Tracking
3. Complete a Desktop Assessment of Illicit Discharge Potential
4. Develop Program Goals and Implementation Strategies
5. Search for Illicit Discharge Problems in the Field
6. Isolate and Fix Individual Discharges
7. Prevent Illicit Discharges
8. Evaluate the Program
Component 1 - Auditing Existing Resources and Programs

• **Purpose:**
  - to identify the most capable local agency to staff and administer the IDDE program,
  - analyze staffing and resource gaps, and
  - search for all available local resources and expertise

• **Method:** performance of a local IDDE “audit,”
  - Internal/external research,
  - Agency interviews, and
  - Interagency meetings

  to determine existing resources and program gaps

Component 1 - Auditing Existing Resources and Programs

- Infrastructure Profile – Valley Township
Component 1 - Auditing Existing Resources and Programs

- Establish Legal Authority

- Does your community have adequate legal authority to regulate illicit discharges through the following actions
  - Evaluate and modify plumbing codes
  - Prohibit illicit discharges
  - Investigate suspected illicit discharges
  - Require elimination of illicit discharges
  - Carry out enforcement actions
Component 1 - Auditing Existing Resources and Programs

- Review Available Mapping
  - Coverage and quality of mapping resources
  - Geographic Information System (GIS)
    - what digital mapping layers does it contain?
Component 1 - Auditing Existing Resources and Programs

- Availability of Field Staff
  - Field staff play a critical role
    - walk streams, assess outfalls, collect samples, respond to discharge complaints, and handle enforcement
  - Evaluate the availability of local staff to perform these functions, and their training needs
  - Develop initial estimate of the staff time needed for field crews
Component 1 - Auditing Existing Resources and Programs

- Access to Laboratory Analysis
  - Contract services from a private lab
  - Use existing lab facilities - drinking water or wastewater treatment plants
  - Partner with a local water and sewer district, university or community college
  - Develop your own “in-house” monitoring and lab capability
Component 1 - Auditing Existing Resources and Programs

- Education and Outreach
  - Look for other groups that are already involved in storm water or watershed education
    - parks, schools, watershed groups, utilities
  - Look for the current tools the public can use to report water quality problems
    - complaint hotlines, websites or community liaison offices
    - “piggy back” illicit discharge reporting at little additional cost
Component 1 - Auditing Existing Resources and Programs

- Discharge Removal Capability and Tracking
  - Evaluate local capacity to locate specific discharges, make needed corrections or repairs, and take any enforcement actions
  - Contract these services
Component 1 - Auditing Existing Resources and Programs

- Program Funding
  - Review the cost of IDDE program compliance for Phase I NPDES communities (CWP 2002 survey)
  - Construct unit cost budgets for each program component, based on an assumed level of effort
  - Use EPA estimated compliance costs for Phase II IDDE program of $1.30 per capita (with a large range $0.04 to $2.61/capita)
Component 1 - Auditing Existing Resources and Programs

Questions
Component 2 - Establishing Responsibility and Legal Authority

• **Purpose:**
  - Establish legal and administrative authority to regulate, respond and enforce illicit discharges in the community
  - Review local plumbing codes to ensure that inappropriate connections are prohibited,
  - Develop a tracking system to locate illicit discharges and track management response

• **Method:**
  - Development of a new or amended illicit discharge control ordinance
  - Creation of a relational computer database for internal and external tracking of illicit discharges.
Component 2 - Establishing Responsibility and Legal Authority

- Who?
- What?
- How?
Component 2 - Establishing Responsibility and Legal Authority

• **Who** is responsible?

  - Department that oversees MS4
  - Coordination and communication with different departments is essential
  - Collaboration with adjacent or nearby permittees (regional approach – common watershed)
Component 2 - Establishing Responsibility and Legal Authority

• For *what* are they responsible?

  ➢ Develop new or amended illicit discharge control ordinance
  
  ➢ Key components
    ▪ prohibit illicit discharges
    ▪ investigate suspected illicit discharges
    ▪ enforce elimination of illicit discharges
Component 2 - Establishing Responsibility and Legal Authority

- For *what* are they responsible?
  - Define illicit discharge
    - short, concise
    - list of specific substances or practices
  - Define illicit connection
  - Provisions for Access and Inspection
Component 2 - Establishing Responsibility and Legal Authority

Model Illicit Discharge and Connection Stormwater Ordinance

ORDINANCE NO. _____

SECTION 1. PURPOSE/INTENT.
The purpose of this ordinance is to provide for the health, safety, and general welfare of the citizens of (__________) (through the regulation of non-storm water discharges to the storm drainage system to the maximum extent practicable as required by federal and state law). This ordinance establishes methods for controlling the introduction of pollutants into the municipal separate storm sewer system (MS4) in order to comply with requirements of the National Pollutant Discharge Elimination System (NPDES) permit process. The objectives of this ordinance are:

(1) To regulate the contribution of pollutants to the municipal separate storm sewer system (MS4) by stormwater discharges by any user.
(2) To prohibit illicit connections and discharges to the municipal separate storm sewer system.
(3) To establish legal authority to carry out all inspection, surveillance and monitoring procedures necessary to ensure compliance with this ordinance.

SECTION 2. DEFINITIONS.
For the purposes of this ordinance, the following shall mean:

Authorized Enforcement Agency: employees or designees of the director of the municipal agency.
Component 2 - Establishing Responsibility and Legal Authority

- *How* will they enforce the ordinance?
  
  - Enforcement Tools
    - escalating enforcement measures
    - voluntary compliance
    - aggressive enforcement
Component 2 - Establishing Responsibility and Legal Authority

- **How** will they enforce the ordinance?
  - Enforcement Tools
    - escalating enforcement measures
    - voluntary compliance
    - aggressive enforcement

- Written Warning with Voluntary Compliance
- Written Notice of Violation Ordering Compliance
- Administrative Penalties
- Civil Penalties
- Compensatory Action
- Criminal Prosecution
- Cost of Abatement of the Violation/Property Liens
- Emergency Cease and Desist Order
- Suspension of Water or Sewer Service
- Stop Work Order
Component 2 - Establishing Responsibility and Legal Authority

• *How* will they enforce the ordinance?
  - Enforcement Tools
    - escalating enforcement measures
    - voluntary compliance
    - aggressive enforcement
  - Establish a Tracking and Reporting System
    - important from legal perspective
Case Study – City of Raleigh, NC

- The City of Raleigh, Water Quality Group (WQG) within the Public Works Department oversees the City’s IDDE Program.

- The WQG was created in the early 1990s to be responsible for surface water quality across the City and to ensure compliance with the City’s NPDES permits.

- Raleigh’s Illicit Discharge Ordinance - adopted in the second year of their original NPDES Phase I Permit.
  - defines and prohibits illicit discharges and illicit connections;
  - Requires containment and clean-up of spills/discharges (it is also standard operating procedure that the City fire chief be notified of any spills immediately);
  - allows for guaranteed right of entry for inspection of suspected discharges and connections;
  - outlines escalating enforcement measures, including civil and criminal penalties.

- Some functions are undertaken by the City’s Public Utilities Department (dye testing, CCTV, sewer repairs)

- Began with a flat annual IDDE budget
  - More recently, began receiving additional funds from the City’s storm water utility
  - Cleaning and correction costs are funded through various budgets depending on the illicit discharge source
Component 2 - Establishing Responsibility and Legal Authority

Questions

Ask

?'

S
LET'S TAKE A BREAK!

10 minutes
Component 3 - Desktop Assessment of Illicit Discharge Potential (IDP)

- **Purpose:**
  - to determine the potential severity of illicit discharges within a community, and
  - identifies which subwatersheds or generating land uses merit priority investigation

- **Method:**
  - Delineate subwatersheds
  - Compile available mapping and data (e.g., land use, age, outfalls, infrastructure history)
  - Derive subwatershed discharge screening factors using GIS analysis
  - Screen and rank illicit discharge potential at the subwatershed and community level
  - Generate maps to support field investigations
Component 3 - Desktop Assessment of Illicit Discharge Potential (IDP)

- Overview of Desktop Assessment of Illicit Discharge Potential
  - Initial Characterization
    - Existing background data and anecdotal information
  - Subwatershed Screening Ranking
    - **Low** – No known illicit discharge problems in the subwatershed
    - **Medium** – Problems are confined to a few stream reaches, outfalls or specific generating sites in the subwatershed
    - **High** – Problems are suspected to be severe throughout the subwatershed
Component 3 - Desktop Assessment of Illicit Discharge Potential (IDP)

• Overview of Desktop Assessment of Illicit Discharge Potential

  ➢ Subwatershed Screening Tools

  ▪ Step 1: Delineate subwatersheds
  ▪ Step 2: Compile mapping layers and subwatershed data
  ▪ Step 3: Compute discharge screening factors
  ▪ Step 4: Screen for illicit discharge potential at the subwatershed and community level
  ▪ Step 5: Generate maps to support field investigations
Component 3 - Desktop Assessment of Illicit Discharge Potential (IDP)

- Overview of Desktop Assessment of Illicit Discharge Potential
  - Subwatershed Screening Tools
    - Step 1: Delineate subwatersheds
      - smaller, more manageable units – easier to characterize and screen
Component 3 - Desktop Assessment of Illicit Discharge Potential (IDP)

• Overview of Desktop Assessment of Illicit Discharge Potential
  ➢ Subwatershed Screening Tools
    ➢ Step 2: Compile mapping layers and subwatershed data
      ✤ GIS preferred
      ✤ hydrologic, infrastructure and topographic map layers
      ✤ extend beyond the political boundaries
Component 3 - Desktop Assessment of Illicit Discharge Potential (IDP)

- Map layers

<td>5 (1)</td>
<td>15% (1)</td>
<td>29 (1)</td>
<td>20 (1)</td>
<td>6</td>
<td>1.5</td>
</tr>
</tbody>
</table>

* The number in parentheses is the IDP “score” (with 3 having a high IDP) earned for that subwatershed and screening factor. Basis for assigning scores (based on benchmarks) to assess IDP is as follows:
  - Past discharge complaints/reports: <5 = 1; 5-10 = 2; >10 = 3
  - Dry weather water quality: <25% = 1; 25-50% = 2; >50% = 3
  - Storm water outfall density: <10 = 1; 10-20 = 2; >20 = 3
  - Average age of development: <25 = 1; 25-50 = 2; >50 = 3

** Normalizing the raw IDP scores (by dividing the raw score by the number of screening factors assessed) will produce scores that fall into the standard scale of 1 to 3 for low to high IDP, respectively.
Component 3 - Desktop Assessment of Illicit Discharge Potential (IDP)

• Overview of Desktop Assessment of Illicit Discharge Potential
  ➢ Subwatershed Screening
    ▪ Step 5: Generate Maps to Support Field Investigations
Component 3 - Desktop Assessment of Illicit Discharge Potential (IDP)

Questions
Component 4 - Developing Program Goals and Implementation Strategies

- **Purpose:**
  - To define the goals and performance milestones to measure progress
  - To select the most appropriate and cost effective strategies to find, fix and prevent illicit discharges

- **Method:**
  - Analyze the results of the IDDE audit, desktop analysis and local water quality conditions
  - Develop realistic, achievable and measurable goals for the program
  - Goals and strategies should closely align with the type and severity of water quality problems and local watershed management priorities
Component 4 - Developing Program Goals and Implementation Strategies

- Develop Program Goals
  - Four broad types of goals
    - Overall program administration
    - Outfall assessment
    - Preventing illicit discharges
    - Finding and fixing illicit discharge
## Component 4 - Developing Program Goals and Implementation Strategies

### GOALS RELATED TO OVERALL PROGRAM ADMINISTRATION

Component 4 - Developing Program Goals and Implementation Strategies

- Staff Training Video
Component 4 - Developing Program Goals and Implementation Strategies

- Crafting Implementation Strategies
  - most important implementation strategy is targeting
  - screening, education and enforcement efforts should always be focused on subwatersheds, catchments or generating sites with the greatest IDP
Component 4 - Developing Program Goals and Implementation Strategies

<table>
<thead>
<tr>
<th>TYPE</th>
<th>IMPLEMENTATION STRATEGY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low IDP</td>
<td>• Conduct field screening of outfalls in the context of broader watershed assessment and restoration initiatives or a comparable physical stream assessment approach that has broader focus and benefits.</td>
</tr>
<tr>
<td></td>
<td>• Integrate IDDE program efforts into more comprehensive watershed assessment and restoration efforts where multiple objectives are being pursued (e.g., storm water education)</td>
</tr>
<tr>
<td></td>
<td>• Target and coordinate with existing small watershed organizations to accomplish inventory and data collection efforts</td>
</tr>
<tr>
<td></td>
<td>• Establish hotline to report suspicious discharges.</td>
</tr>
</tbody>
</table>
### Component 4 - Developing Program Goals and Implementation Strategies

#### Linking Implementation Strategies to Community–Wide IDP

<table>
<thead>
<tr>
<th>TYPE</th>
<th>IMPLEMENTATION STRATEGY</th>
</tr>
</thead>
</table>
| Medium IDP      | • Conduct limited sampling in the suspect areas. The most cost-effective approach will likely involve using outside laboratory services or a municipal laboratory  
• Select a small set of indicator parameters using the nature of historic problems and land use as a guide  
• Target education program in problem areas  
• Look for partnerships with local watershed groups to regularly monitor problem areas  
• Establish a hotline to report suspicious discharges |
# Component 4 - Developing Program Goals and Implementation Strategies

## Linking Implementation Strategies to Community–Wide IDP

<table>
<thead>
<tr>
<th>TYPE</th>
<th>IMPLEMENTATION STRATEGY</th>
</tr>
</thead>
</table>
| High IDP | • Establish a hotline to report suspicious discharges.  
              • Conduct and repeat screening in all subwatersheds  
              • Plan for more rigorous sampling approach  
              • Develop a community-specific chemical “fingerprint” of various flow sources to facilitate differentiation between likely flow sources  
              • Develop community-wide educational messages aimed at increasing public awareness  
              • Lead by example  
              ▪ Emphasize cross-training of municipal employees  
              ▪ Ensure municipal facilities are not contributing to illicit discharge problem |

</table>
| Discharges from Generating Sites | • Density of generating sites  
• Older industry  
• Past complaints and reports | • Link IDDE program to existing industrial NPDES discharge permits  
• Inspect SWPPPs  
• Develop targeted training and technical assistance programs tailored to specific generating sites  
• Aggressively enforce fines and other measures on chronic violators |
Component 4 - Developing Program Goals and Implementation Strategies

Questions
Component 5 - Searching for Illicit Discharge Problems in the Field

• **Purpose:**
  - Detective work
  - Rapid field screening of outfalls in priority subwatersheds
  - Followed by indicator monitoring at suspect outfalls to characterize flow types

• **Method:**
  - Outfall Reconnaissance Inventory (ORI)
  - Used to find illicit discharge problems
  - Develop a systematic outfall inventory
Component 5 - Searching for Illicit Discharge Problems in the Field

- The Outfall Reconnaissance Inventory (ORI)
  - stream walk
  - to inventory and measure storm drain outfalls
  - find and correct “obvious” continuous and intermittent discharges without in-depth laboratory analysis
  - Initially completed for every stream mile
Component 5 - Searching for Illicit Discharge Problems in the Field

- The Outfall Reconnaissance Inventory (ORI)
  - Outcome/Product
    - An updated map of the locations of all outfalls within the MS4
    - Design and implementation of an indicator monitoring strategy to test suspect outfalls
    - Creation of a local chemical “fingerprint” library of pollutant concentrations for various discharge flow types
Component 5 - Searching for Illicit Discharge Problems in the Field

<table>
<thead>
<tr>
<th>Step</th>
<th>Strategies</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1. Acquire necessary mapping, equipment and Staff</td>
<td>• Use maps from initial assessment&lt;br&gt;• Minimal field equipment required&lt;br&gt;• Two staff per crew with only basic field training required</td>
</tr>
<tr>
<td>Step 2. Determine when to conduct field screening</td>
<td>• During dry season and leaf off conditions&lt;br&gt;• After a dry period of at least 48 hours&lt;br&gt;• Low groundwater levels</td>
</tr>
<tr>
<td>Step 3. Identify where to conduct field screening (based on desktop assessment)</td>
<td>• Low IDP: integrate field screening with broader watershed or stream assessments&lt;br&gt;• Medium IDP: screen drainage areas with higher ranking first for illicit discharge potential&lt;br&gt;• High IDP: screen all outfalls systematically</td>
</tr>
<tr>
<td>Step 4. Conduct field screening</td>
<td>• Mark and photograph all outfalls&lt;br&gt;• Record outfall characteristics&lt;br&gt;• Simple monitoring at flowing outfalls&lt;br&gt;• Take flow sample at outfalls with obvious or likely problems&lt;br&gt;• Deal with major problems immediately</td>
</tr>
</tbody>
</table>
Component 5 - Searching for Illicit Discharge Problems in the Field

• The Outfall Reconnaissance Inventory (ORI)
  ➢ Four Basic Steps to Interpret ORI Data
    ▪ Step 1. Compile data from the ORI
    ▪ Step 2. Develop ORI designation for outfalls
    ▪ Step 3. Characterize the extent of illicit discharge problems
    ▪ Step 4. Develop a monitoring strategy
Component 5 - Searching for Illicit Discharge Problems in the Field

• The Outfall Reconnaissance Inventory (ORI)

  ➢ Four Basic Steps to Interpret ORI Data

  ▪ Step 4. Develop a monitoring strategy
    o Use ORI data to prioritize problem outfalls or drainage areas
    o Select the type of indicators needed for your discharge problems
    o Decide whether to use in-house or contract lab analytical services
    o Consider the techniques to detect intermittent discharges
    o Develop a chemical library of concentrations for various flow types
    o Estimate staff time, and costs for equipment and disposable supplies
Component 5 - Searching for Illicit Discharge Problems in the Field

- The Outfall Reconnaissance Inventory (ORI)
  - Step 4. Develop a monitoring strategy

Location & Type Of Water Quality Contaminant
Component 5 - Searching for Illicit Discharge Problems in the Field

Questions
Component 6 - Isolating and Fixing Individual Illicit Discharges

- **Purpose:**
  - to trace illicit discharge problems back up the pipe to isolate the specific source or improper connection that generates the discharge

- **Method:**
  - Five basic tools
    - Pollution reporting hotline
    - Drainage area investigations
    - Trunk investigations
    - On-site discharge investigations
    - Correction and enforcement
Component 6 - Isolating and Fixing Individual Illicit Discharges

- Pollution reporting hotline
- Storm drain network investigations
  - Work progressively up the trunk from the outfall and test manholes along the way
  - Split the trunk into equal segments and test manholes at strategic points of the storm drain system
  - Work progressively down the trunk (i.e., from the headwaters of the storm drain network and move downstream)
Component 6 - Isolating and Fixing Individual Illicit Discharges

- Drainage area investigations
  - Office – land use maps, SIC Code review, aerial photography
- On-site investigations
  - Field – dye testing facilities, septic tank and drain field inspection
- Septic system investigations
  - Community septic systems – breakout, straight pipe bypass discharges
Component 6 - Isolating and Fixing Individual Illicit Discharges

Component 6 - Isolating and Fixing Individual Illicit Discharges

Questions
Component 7 - Preventing Illicit Discharges

• **Purpose:**
  - Identify key behaviors of neighborhoods, generating sites, and municipal operations that produce intermittent and transitory discharges
  - Target “discharge behaviors” improved pollution prevention practices

• **Method:**
  - Identifying major behaviors
    - The Unified Subwatershed and Site Reconnaissance (USSR; Wright et al., 2004)
    - Desktop analysis of potential generating sites
  - Source Control Plan
    - choose the appropriate combination of carrots and sticks to change behaviors
Component 7 - Preventing Illicit Discharges

- The Unified Subwatershed and Site Reconnaissance (USSR; Wright et al., 2004)
  - rapid field survey to evaluate potential pollution sources and restoration opportunities within urban subwatersheds
  - Checklists
Component 7 - Preventing Illicit Discharges

- Preventing Illicit Discharges
  - Public education and outreach
  - Public participation/involvement
  - Municipal pollution prevention/good housekeeping
  - Enforcement
Component 8 - IDDE Program Tracking and Evaluation

• **Purpose:**
  - address the ongoing management of the IDDE program
  - review progress made in meeting the measurable program goals established earlier in the permit cycle
  - Adaptive management is critical

• **Method:**
  - frequent maintenance and analysis of the IDDE tracking system
